

DESCRIPTION

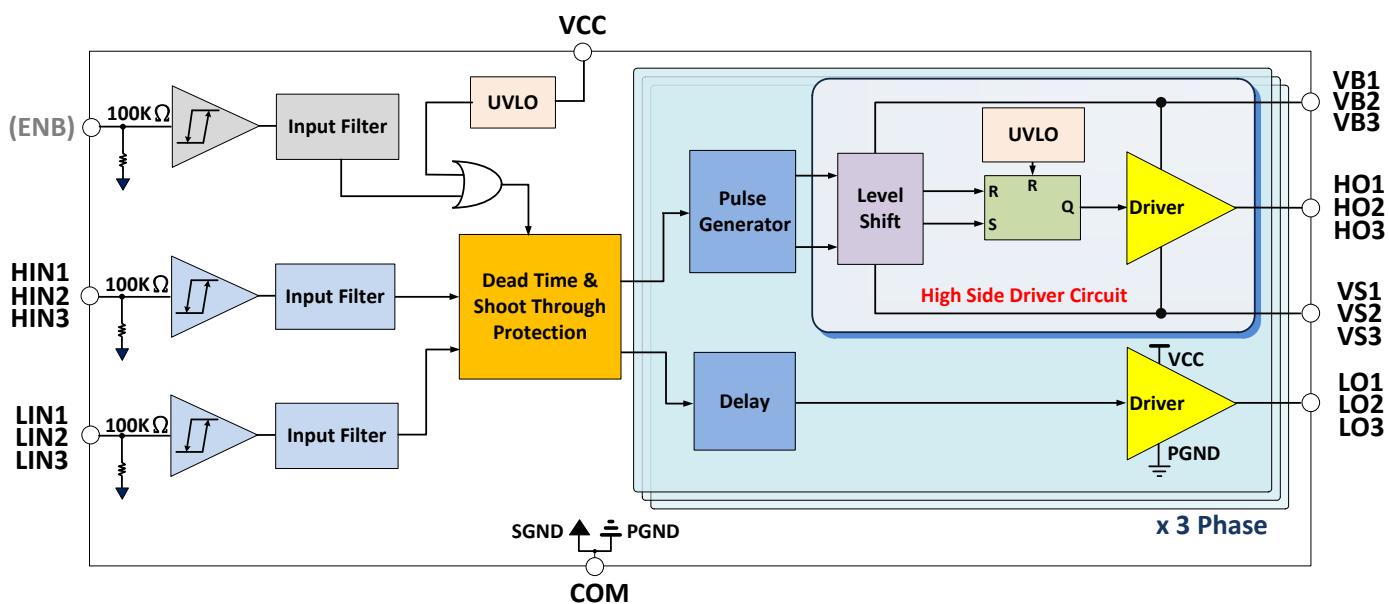

The PT5619 is a high-speed 3-phase gate driver for power MOSFET and IGBT devices with three independent high and low side referenced output channels. Built-in dead time protection and shoot-through protection prevent damage to the half-bridge. The UVLO circuits prevent malfunction when VCC and VBS are lower than the specified threshold voltage. A novel high-voltage BCD process and common-mode noise canceling technique provide stable operation of high-side drivers under high dV/dt noise conditions while achieving excellent negative transient voltage tolerance. An enable pin (ENB) is included so that standby mode may be used to set the chip into a low quiescent current state to realize long battery lifetime.

APPLICATION

- E-BIKE/electric power tool 3-phase motor driver
- Battery-powered mini/micro motor control
- General purpose inverter

FEATURES

- Integrated 90V half-bridge high side driver
- Ability to drive up to 3-phase half-bridge gates
- Built-in dead time protection
- Shoot-through protection
- Under voltage lockout for VCC and VBS
- Low operation voltage 0–5.5V for VCC and VBS
- 3.3V and 5V input logic compatible
- Enable pin (ENB) for low standby current
- IO+/IO-: +1.2A/-2.0A at VCC=15V, VBS=15V
- Built-in dead time: 0.5μs (typ.)
- Common-mode dV/dt noise cancellation circuit
- Tolerant of negative transient voltage
- Low dI/dt gate drive for better noise immunity
- -40°C to 125°C operating range
- Small footprint package: TSSOP20L/24L, QFN24

FUNCTION DESCRIPTION

LOW SIDE POWER SUPPLY: VCC AND UVLO

VCC is the low side supply and it provides power to both input logic and low side output power stage. The built-in under-voltage lockout circuit enables the device to operate at sufficient power when a typical VCC supply voltage higher than $V_{CCUV+} = 4.2V$ is present, shown as Figure. 1. The PT5619 shuts down all the gate driver outputs, when
